                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAW81466 to AAW81476 represent synthetic amyloid beta (Abeta) peptides. The invention provides a process for treating a synthetic Abeta peptide in that comprises dissolving the peptide in a deoxygenated solvent selected from trifluoroethanol, hexafluorocyclohexane, dimethyl sulphoxide, morpholinopropanesulphonic acid, dimethylformamide and acetonitrile to a concentration of 0.01-10 mg/ml, incubating the solution at 20-65 deg. C for 0.5-4 hour, and removing the solvent by 'evaporative deposition' in 5-10 minutes. Synthetic amyloid beta peptides are useful as research tools for studying neurotoxicity resulting from Abeta peptide of the synthetic Abeta peptides in tests to determine free-radical production. The treatment increases the activity generating capacity and glutamine synthetase inactivation

The peptide may be conjugated to polymer molecule. Antibodies raised against the peptides are also included. The peptide is useful for inducing an immune response to amyloid beta peptides and amyloid deposits and therefore treating Alzheimer's disease. The antibody is useful for reducing the formation of amyloid fibrils and deposits. The peptide has a reduced ability to adopt a beta-sheet confirmation as an antigenic source, and a much lower risk of leading to any toxic effects in humans. The present sequence is a human amyloid beta 1-42, residues 1-30 which is used as a basis for the peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated synthetic immunogenic but non-amyloidogenic peptide homologous to amyloid beta, useful for inducing immune response to amyloid beta peptides and amyloid deposits.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence comprises amino acid residues 1-30 of the amyloid beta(1-42) protein. The invention provides a synthetic immunogenic but non-amyloidogenic peptide homologous to this sequence, where 0-5 of hydrophobic residues 17-21 are substituted with Lys, Asp, Glu, Pro, Gly or Ser, and preferably also include an N-terminal and/or C-terminal segment of 4-10 Lys or Asp residues. Preferred peptides are given in ABR42770-73, ABR42777-78 and ABR42783-88. The peptides, alone or conjugated to an immunostimulant, are used to induce an immune response
Human fusion antibody for reducing cerebral amyloid fibers associated
                                                                                                                                                                                                                                                                                              13-JUL-2001; 2001CN-00120278
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Beta-amyloid peptide #7 recognised by antibody to treat senile dementia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              06-MAY-2004

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated amyloid beta peptide or its chomologue which is selected by a method comprising: (a) determining the cc binding value of each amino acid of a subsequence of amyloid beta peptide cc upon binding to a HLA class I and/or class II molecule of interest; (b) cc determining the resulting score of all amino acids of the subsequence, based on the binding value of each amino acids obtained in step (1); and (C) comparing the resulting score to a preselected value. Also described: (1) a vaccine comprising the isolated amyloid beta peptide and a carrier cc or diluent; (2) determining T-cell epitopes within amyloid beta peptide; (3) predicting the reaction of an individual to a vaccine; (4) matching a vaccine comprising a beta amyloid or homologue peptide to an individual, (5) a kit for matching a vaccine comprising amyloid beta peptide to an individual; (5) a kit for matching a vaccine comprising amyloid beta peptide to an individual based on the HLA haplotype of the individual; (5) a kit for matching a vaccine comprising amyloid beta peptide to an individual based on the HLA haplotype of the individual; (5) a kit for matching a vaccine comprising amyloid beta peptide to an individual based on the HLA haplotype of the individual;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The invention relates to an amino acid composition (I), with improved CC blood brain barrier permeability, comprising a chemically synthesized camino acid polymer comprising at least one asparagy1-4-aminobutane or glutamy1-4-aminobutane residue. Also described: (I) creating an amino acid polymer with improved blood brain barrier permeability comprising CC chemically synthesizing an amino acid polymer (where at least one asparagy1-4-aminobutane or glutamy1-4-aminobutane residue is incorporated contribution of the process of the synthesizing an amino acid polymer (where at least one superagy1-4-aminobutane or glutamy1-4-aminobutane residue is incorporated contribution of alpha-Fmoc-L-asparty1-alpha-(4-aminobuty1)-carbamic acid contributylester or N-alpha-Fmoc-L-glutamy1-delta-(4-aminobuty1) carbamic acid cert-butylester or N-alpha-Fmoc-L-glutamy1-delta-(4-aminobuty1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The amyloid beta peptide is useful for preparing a comp for preventing the formation or progression of amyloid plaques for preventing or treating Aliheimer's disease. The present sequence represents an amyloid beta (Abeta) peptide, which is used in an efrom the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amino acid composition, useful in molecular imaging, comprises chemically synthesized amino acid polymer comprising at least asparagyl-4-aminobutane or glutamyl-4-aminobutane residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example; SEQ ID NO 5; 24pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SXS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                 The invention relates to a novel recombinant chimeric Hepatitis B virus concleocaspid (core) protein (HBC), up to 600 or 380 amino acid residues in length. The chimeric protein is engineered for both enhanced stability of self-assembled particles and the substantial absence of nucleic acid conding by the particles. The invention further comprises: a recombinant HBC protein chimeric molecule that has a length of 135-365 amino acid cresidues and contains four peptide-linked amino acid residue sequence domains from the N-terminus that are denominated Domains I, I, II and IV. The invention also provides nucleic acids, polypeptides, host cells, vectors and transgenic animals used in the methods of the invention. The chimeric compositions of the invention have hepatotropic and virucide activities. The methods and compositions of the present invention are useful in the fields of immunology and protein engineering, in particular for using a chimeric hepatitis B virus nucleocapsid protein as an immunogen in a vaccine for Hepatitis B infections. This sequence composents a Hepatitis B virus nucleocapsid protein related complements and the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                Sequences AAW81466 to AAW81476 represent synthetic amyloid beta (Abeta) peptides. The invention provides a process for treating a synthatic Abeta peptide in that comprises dissolving the peptide in a deoxygenated solvent selected from trifluoroethanol, hexafluorocyclohexane, dimethyl sulphoxide, morpholinopropanesulphonic acid, dimethylformamide and acetonitrile to a concentration of 0.01-10 mg/ml, incubating the solution at 20-65 deg. C for 0.5-4 hour, and removing the solvent by 'evaporative deposition' in 5-10 minutes. Synthetic amyloid beta peptides are useful as research tools for studying neurotoxicity resulting from Abeta peptide enhanced free-radical production. The treatment increases the activity of the synthetic Abeta peptides in tests to determine free-radical
                                                                                                                                                                                                                                                                                          Sequence 33 AA;

The invention relates to a recombinant hepadnavirus nucleocapsid protein, CC i.e. a chimeric hepatitis B core (HBC) protein (I), displaying one or CC more immunogenic epitopes at the N-terminus, HBC immunogenic loop (L) or CC C-terminus or having a heterologous linker for a conjugated epitope in CC (L), and containing a Cys residue at, or near, the C-terminus that CC confers enhanced stability to the particles. A vaccine comprising (I) is CC useful for inducing an immune response in an inoculated host animal, by CC inoculating a host animal with the vaccine, and maintaining that CC inoculated animal for a time period sufficient for that animal to develop CC an immune response. The immunogenic particles formed using (I) are CC terminal residue or in which a C-terminal Cys is replaced by another CC terminal residue or in which a C-terminal Cys is replaced by another CC terminal Cys residues. The chimer particles are most stable on storage in aqueous CC compositions that are particles of similar sequence that lack any C-CC terminal Cys residues. The chimer molecule exhibits the self-assembly not CC terminal Cys residues. The chimer molecule exhibits the self-assembly not CC terminal Cys. The particles are free CC terminal Cys. The particles are free CC exhibiting the nucleic acid binding of those native particles are CC terminal Cys. The particles are free CC similar particles assembled from the chimer molecules are conjugates that lack a C-terminal Cys. Immunogenic than CC terminal Cys. Aluganga, Alugan

The methods and compositions of the present the amino acid sequence of a chimeric hepatitis B infection. This is epitope useful for treating chromic hepatitis B virus related B-cell epitope useful for expression within the HBV chimer at the N-terminus, within the immunoigenic loop and/or at the C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hepatotropic; virucide; antiinflammatory; chronic hepatitis; vaccine; recombinant hepatitis B core chimeric protein; HBc chimeric protein; hepatitis B infection; T-cel stimulator; B-cell epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC hepatitis B core (AHBc) nucleocapsid proteins. Specifically, it refers to CC an AHBc protein that has been engineered to display an immunogenic B cell CC or T cell epitope, exhibit enhanced stability and an absence of nucleic CC acid binding as a self assembled particle. The present invention CC describes the chimeric AHBc protein as truncated at the C-terminus and CC containing introduced cysteine residues that confers an enhanced CC stability in aqueous solution, an increased yield and more immunogenicity CC than similar conjugates that lack N - or C-terminal cysteines.

CC (lysine and arginine) towards the C-terminal prepares self-assembled CC particles that are substantially free of nucleic cold binding. As such, CC these chimeric particles can be used as immunogens of an inoculum that CC induce a B cell or T cell response in an animal to produce antibodies. It CC an also be useful for developing a vaccine to protect against the CR accordingly, these compositions exhibit immunostimulant, antibacterial CC and virucidal activities. This peptide sequence is an exemplary B-cell CC epitope peptide immunogen useful for both linkage to the linker residue CC after expression of a contemplated chimer and for expression within an CC HBC chimer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a recombinant chimer hepatitis B core (HBC) protein molecule that includes a peptide-bonded heterologous immunogenic epitope at the N-terminus in the HBC immunodominant loop or the C-terminus of the chimer, or a heterologous linker residue for a conjugated epitope present in the loop. The invention also relates to an immunogenic particle comprising the recombinant hepatitis B core chimeric protein molecules, a vaccine comprising the immunogenic particles dissolved or dispersed in a diluent, a nucleic acid that encodes a recombinant HBC protein molecule or its variant, analogue, or complement and a method for inducing an immune response in an inoculated host animal comprising inculating a host animal with a vaccine and maintaining the inoculated animal for a period of time sufficient to enable development of an immune response. The recombinant chimer hepatitis B core protein molecule is
                            New recombinant chimer hepatitis B core (HBc) protein molecules useful the fields of immunology and protein engineering, in particular as an immunogen in a vaccine for Hepatitis B infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      transgenic animal; I enhanced stability;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant chimer hepatitis B core protein molecule useful for preparing vaccine or inoculum includes peptide-bonded heterologous immunogenic epitope at N-terminus in the hepatitis B core immunodominant loop or C-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           binding by the particles. The invention further comprises: a recombinant HBC protein chimeric molecule that has a length of 135-365 amino acid residues and contains four peptide-linked amino acid residue sequence domains from the N-terminus that are denominated Domains I, II, III and IV. The invention also provides nucleic acids, polypeptides, host cells, vectors and transgenic animals used in the methods of the invention. The chimeric compositions of the invention have hepatotropic and virucide activities. The methods and compositions of the present invention are useful in the fields of immunology and protein engineering, in particular for using a chimeric hepatitis B virus nucleocapsid protein as an immunogen in a vaccine for Hepatitis B virus nucleocapsid protein related polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                         Human; chronic hepatitis; HBc; nucleocapsid core protein; vaccine; immunogen; immunogenic epitope; T cell; B cell; CD8+ cell; CD4+ cel cytotoxic T lymphocyte; toll-like receptor 4; toll-like receptor 9;
                                       Treating chronic hepatitis, by administering vaccine comprising immunogenic particles having recombinant hepatitis B core chimeric protein molecules, that stimulates T cell, to patient chronically
                                                                                                                                                                                                                                                                                         01-OCT-2003; 2003US-00677074.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ADR12778 standard; peptide; 33
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel recombinant chimeric Hepatitis B virus nucleocaspid (core) protein (HBC), to 600 or 380 amino acid residues in length. The chimeric protein is engineered for both enhanced stability of self-assembled particles and the substantial absence of nucleic acid

Also included is enhancing (M2) the particles display CC enhanced stability. Also included is enhancing (M2) the production of one CC or more of gamma-producing (CB+, CD4+ T cells and cytotoxic T lymphocytes CC enainst hepatitis B virus, involving administering to a patient CC chronically infected with hepatitis B virus, a T cell-stimulating amount CC diluent containing one or both of an agonist of toll-like receptor 4 and receptor 9 (TR-4 and TR-9), the immunogenic particles comprising HBC CC induction concernically infected and maintaining the patient for a sufficient CC induction protein molecules and maintaining the patient for a sufficient CC may be B cell or T cell epitopes. The chimeric vaccine is useful for treating a patient chronically infected with hepatitis B virus. The CC present sequence is a B cell epitope suitable for inclusion in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Ma

The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta for the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid disease including inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sample with labelled BAP, optionally in the presence of a test agent, detecting the amount of label bound to the silk and assessing the effect of the agent on the deposition of BAP. Agents that inhibit binding of BAP to silk are potentially useful for treating amyloidosis diseases, especially Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 35 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine antigen amyloid-beta related amino acid sequence
The present invention describes compositions (C) comprising: (a) agent (a1) that prevents or treats amyloid-beta related disease;
                                                                             Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulato:
                                                                                                                                                                                                                                               24-DEC-2002;
23-JUN-2003;
                                                                                                                                                                                                                                                                                                                            15-JUL-2004
                                                                                                                                                                                                                                                                                                                                                                                                               Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ADQ37254 standard; peptide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 35 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAW81466 to AAW81476 represent synthetic amyloid beta (Abeta) peptides. The invention provides a process for treating a synthetic Abeta peptide. That comprises dissolving the peptide in a decaygemated solvent selected from trifluoroethanol, hexafluorocyclohexane, dimethyl sulphoxide, morpholinopropanesulphonic acid, dimethylformamide and acetonitrile to a concentration of 0.01-10 mg/ml, incubating the solution at 20-65 deg. C for 0.5-4 hour, and removing the solvent by "evaporative deposition" in 5-10 minutes. Synthetic amyloid beta peptides are useful as research tools for studying neurotoxicity resulting from Abeta peptide enhanced free-radical production. The treatment increases the activity of the synthetic Abeta peptides in tests to determine free-radical
The invention relates to an isolated synthetic immunogenic but non-amyloidogenic peptide homologous to amyloid beta. The peptide may be conjugated to polymer molecule. Antibodies raised against the peptides are also included. The peptide is useful for inducing an immune responser
                                                                                                                                                                                                                                                                                                                                                                             Amyloid beta; non-amyloidogenic peptide; vaccine; immunogen; Alzheimer's disease; amyloid fibril; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 1999-034120/03.

The antibody is useful for reducing the formation of amyloid fibrils and deposits. The peptide has a reduced ability to adopt a beta-sheet confirmation as an antigenic source, and a much lower risk of leading to any toxic reffects in humans. The present sequence is a synthetic immunogenic but non-amyloidogenic peptide of the invention
                                                                                                                           The invention relates to an isolated synthetic immunogenic but non-amyloidogenic peptide homologous to amyloid beta. The peptide may be conjugated to polymer molecule. Antibodies raised against the peptides are also included. The peptide is useful for inducing an immune response to amyloid beta peptides and amyloid deposits and therefore treating Alzheimer's disease. The antibody is useful for reducing the formation of amyloid fibrils and deposits. The peptide has a reduced ability to adopt a beta-sheet confirmation as an antigenic source, and a much lower risk of leading to any toxic effects in humans. The present sequence is a synthetic immunogenic but non-amyloidogenic peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated synthetic immunogenic but non-amyloidogenic peptide homologous to amyloid beta, useful for inducing immune response to amyloid beta peptides and amyloid deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of a polypeptide, denoted Abeta1-30-K6, comprising amino acid residues 1-30 of amyloid beta(1-42) protein (see also ABR42769) with a C-terminal poly-tys region. The novel polypeptide was shown to be slightly fibrillogenic in vitro but was non-toxic in human neuronal culture. It is an example of amyloid beta homologous polypeptides of the invention that can be used to induce an immune response to amyloid beta peptides for use in reducing amyloidosis. The use of non-fibrillar/non-toxic amyloid beta polypeptides is a safer

The present sequence is that of a novel immunogenic but non-deposit forming polypeptide derived from amino acid residues 1-30 of amyloid beta(1-42) protein (see also ABR42769). The novel polypeptide, denoted K6Abeta1-30.NH2, maintains the 2 major immunogenic sites of amyloid beta peptides, and is amidated at the C-terminus to further preserve antigenicity. Immunization of transgenic APP mice (7g2576) for 7 months with this non-amyoidogenic non-toxic amyloid beta homologous peptide reduced cortical and hippocampal brain amyloid burden by 89% and 81%, respectively, and brain levels of soluble amyloid beta(1-42) were reduced by 57%. K6Abeta1-30-NH2 is an example of amyloid beta homologous polypeptides of the invention that can be used to induce an immune response to amyloid beta peptides for use in reducing amyloidosis. The use of non-fibrillar/non-toxic amyloid beta polypeptides is a safer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New synthetic immunogenic but non-deposit forming peptides, useful for inducing an immune response to prions, amyloids, amylin or amylin fibrils, particularly for treating e.g. Alzheimer's, scrapie or Creutzfeldt-Jacob disease.
                                                                                                                                                                                                                                                         vaccination approach for humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 1; Page 214; 265pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neuroprotective; immunogen; vaccine; human; mutant; mutein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel recombinant chimeric Hepatitis B virus can uncleocaspid (core) protein (HEC), up to 600 or 380 amino acid residues in length. The chimeric protein is engineered for both enhanced stability of self-assembled particles and the substantial absence of nucleic acid binding by the particles. The invention further comprises: a recombinant HBC protein chimeric molecule that has a length of 135-365 amino acid cresidues and contains four peptide-linked amino acid residue sequence domains from the N-terminus that are denominated Domains I, I, II and IV. The invention also provides nucleic acids, polypeptides, host cells, vectors and transgenic animals used in the methods of the invention. The chimeric compositions of the invention have hepatotropic and virucide activities. The methods and compositions of the present invention are useful in the fields of immunology and protein engineering, in particular for using a chimeric hepatitis B virus nucleocapsid protein as an immunogen in a vaccine for Hepatitis is infections. This sequence corepresents a Hepatitis B virus nucleocaspid (core) protein related polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibodies which recognise specific subfragments of the beta-amyloid protein are claimed. Specifically, the antibodies (which are pref. monoclonal) recognise residues 1-16 and/or 1-28 from the N-terminal portion of beta-amyloid or they recognise residues 25-35 or 35-43 from the C-terminal portion. The antibodies are useful for assaying beta-amyloid and its derivatives for diagnosis of Alzheimer's disease. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibodies recognising specific parts of beta-amyloid - can be used diagnosis of diseases implicating beta-amyloid, such as Alzheimer's disease.

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups om blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half if the land apecificity as bonding to large molecules decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modifying peptidase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   neuronal cells and a beta-amyloid peptide neurotoxin. The methods can be used for identifying compounds for treating diseases characterised by an undesirable build up of beta-amyloid protein, e.g. Alzehimer's disease, Down's syndrome, and the syndromes of hereditary cerebral haemorrhage with amyloidosis and non-inherited congophilic angiopathy with cerebral haemorrhage. AAW92731 are tachykinin agonise derived from human beta-amyloid peptide fragments. (Updated on 20-MAR-2003 to correct PF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ន្តន្តន្ត្
                      The present invention describes a modified therapeutic peptide (I) CC comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidy) and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in CC vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. CC Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half ife) and specificity as bonding to large molecules decreases CC intracellular uptake and interference with physiological processes. CC AAB90829 to AAB92441 represent peptides which can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                   The invention describes a preventive and therapeutic agent (I) of an Alzheimer's disease, mild cognitive impairment or brain amyloid angiopathy, comprising a monoclonal antibody (Al) reacting specifically with a partial peptide in the C terminal of beta-amyloid or its derivative(s), where Al does not recognize the partial peptide of beta-amyloid comprising a 11 amino acid sequence (SEQ ID NO. 8) fully defined in the specification. (Al) is useful for manufacturing the preventive-therapeutic agent (I) which is administered in order to prevent and treat alzheimer's disease, mild cognitive impairment or brain amyloid angiopathy. (I) is useful as diagnostic agent for Alzheimer's disease. (I) is useful as diagnostic agent for Alzheimer's disease. (I) is capable of removing beta-amyloid from a formed senile plaque. (I) inhibits aggregation of beta-amyloid in the brain. (I) arrests beta-amyloid at the periphery region. (I) does not induce bleeding from the cerebral blood vessel. This is the amino acid sequence of human beta-amyloid residues 1-38.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cerebroprotective; nootropic; neuroprotective; diagnostic; antibody therapy; Alzheimers disease; degeneration; neurological disease; cognitive disorder; beta-amyloid; amyloid protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preventive and therapeutic agent useful for treating and preventing Alzheimer's disease, mild cognitive impairment, or brain amyloid angiopathy, comprises antibody capable of reacting with partial peptide in C-terminal of beta-amyloid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 5; SEQ ID NO 1; 44pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antibodies which recognise specific subfragments of the beta-amyloid protein are claimed. Specifically, the antibodies (which are pref. monoclonal) recognise residues 1-16 and/or 1-28 from the N-terminal portion of beta-amyloid or they recognise residues 25-35 or 35-43 from the C-terminal portion. The antibodies are useful for assaying beta-amyloid and its derivatives for diagnosis of Alzheimer's disease. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibodies recognising specific parts of beta-amyloid - can be used diagnosis of diseases implicating beta-amyloid, such as Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amyloid precursor anti-beta-amyloid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptide that comprises dissolving the peptide in a deoxygenated solvent selected from trifluoroethanol, hexafluorocylohexane, dimethyl sulphoxide, morpholinopropanesulphonic acid, dimethylformamide and acetonitrile to a concentration of 0.01-10 mg/ml, incubating the solution at 20-65 deg. C for 0.5-4 hour, and removing the solvent by 'evaporative deposition' in 5-10 minutes. Synthetic amyloid beta peptides are useful as research tools for studying neurotoxicity resulting from Abeta peptide enhanced free-radical production. The treatment increases the activity of the synthetic Abeta peptides in tests to determine free-radical generating capacity and glutamine synthetase inactivation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human amyloid beta-A4 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY25134 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences AAW81466 to AAW81476 represent synthetic amyloid beta (Abeta) peptides. The invention provides a process for treating a synthetic Abe

The invention relates to a measurement of the full length beta-amyloid (Abeta) peptide level of a specific Abeta peptide in a sample containing multiple types of Abeta peptide, by capturing and binding one terminus of the types of Abeta peptides with a first antibody. The specific Abeta peptide is captured and bound at an opposite non-overlapping terminus with a second peptide. The invention is used for measuring full length Abeta peptide level useful for tracking the progression of Alzheimer's disease. The new method uses one specific antibody that recognises the N-terminus of all the Abeta peptides and a panel of detection antibodies that distinguish each Abeta peptide (Abeta 1-43, 1-42, 1-41, 1-40 and 1-
                                                                                                                                                                                                                                                                                                                                                    Fong
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (I); (b) measuring the amount of (II) bound to (I) to obtain a value (i); (c) repeating steps (a) and (b) with a second sample at a different time to obtain a second value (ii); and (d) determining the difference between (i) and (ii) which is inversely related to the degree of aggregation of (I). This method may be applied to a screen for compounds that inhibit aggregation of (I). These inhibitors may be used as therapeutic drugs to inhibit the formation of these aggregates in the brains of patients suffering from Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel method for the determination of the degree of aggregation of an amyloid beta A4 peptide (1) in solution. Determination comprises: (a) incubating a sample of unaggregated (I) with Coomassie Brilliant Blue G 250 dye (II) which only binds to unaggregated (1); (b) measuring the amount of (II) bound to (I) to obtain a value (1); (1)
                                                                                                                                                                                                        Disclosure; Fig le; llpp;
                                                                                                                                                                                                                                         Enabling measurement of full length beta-amyloid peptide level tracking progression of Alzheimer's disease, comprises capturing binding terminus of beta-amyloid peptide with antibodies.

The present invention describes a method for inhibiting amyloid toxicity or the formation of an amyloid deposit. The method comprises administering a dosage of one or more agent(s) that bind(s) to a molecule selected from an integrin submit such as alphacetal or alphav, alphac or betal, an integrin such as alphacetal, alphacetal or alphavebral, and laminin, under conditions such that the agent(s) inhibit amyloid toxicity or the formation of an amyloid deposit. Amyloids have mootropic, neuroprotective, antidiabetic and antiparkinsonian activities, and can be used in gene therapy. The method is useful for inhibiting amyloidogenic protein toxicity, inhibiting the formation of an amyloidogenic protein toxicity, inhibiting the formation of an amyloidogenic protein deposit and/or treating amyloidogenic diseases, such as Alzheimer's disease, type II diabetes, Parkinson's disease, a disease caused all or in part by prion infection, hereditary or systemic amyloidosis, or Down's syndrome. The present sequence represents a human Abeta peptide designated Abeta39, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   39) by their sequence difference at the C-terminus. This use of N and terminus specific antibodies allows simultaneous quantification of several Abeta peptides in a single assay. The present sequence is that Abeta (1-39), used to raise the N and C-terminal antibodies of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; Abeta39; amyloid toxicity inhibition; amyloid; integrin subunit; integrin; laminin; nootropic; neuroprotective; antidiabetic; antiparkinsonian; gene therapy; amyloidogenic protein; prion infection; amyloidogenic protein toxicity inhibition; amyloidogenic disease; amyloidosen; parkinson's disease; amyloidosis;

                      The invention describes a preventive and therapeutic agent (I) of an Alzheimer's disease, mild cognitive impairment or brain amyloid angiopathy, comprising a monoclonal antibody (A1) reacting specifically with a partial peptide in the C terminal of beta-amyloid or its derivative(e), where A1 does not recognize the partial peptide of beta-amyloid comprising a 11 amino acid sequence (SEO ID NO. 8) fully defined in the specification. (A1) is useful for manufacturing the preventive-therapeutic agent (I) which is administered in order to prevent and treat Alzheimer's disease, mild cognitive impairment or brain amyloid at the periphery region. (I) is capable of removing beta-amyloid from a formed senile plaque. (I) inhibits aggregation of beta-amyloid in the brain. (I) arrests beta-amyloid at the periphery region. (I) does not induce bleeding from the cerebral blood vessel. This is the amino acid sequence of human beta-amyloid residues 1-38.
                                                                                                                                                                                                                                                                      Preventive and therapeutic agent useful for treating and preventing Alzheimer's disease, mild cognitive impairment, or brain amyloid angiopathy, comprises antibody capable of reacting with partial pept in C-terminal of beta-amyloid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cerebroprotective; nootropic; neuroprotective; diagnostic; Alzheimers disease; degeneration; neurological disease; cognitive disorder; beta-amyloid; amyloid protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 39

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The peptide is an internal fragment of the beta amyloid peptide (BAP) precursor, which was produced synthetically. The peptide, when labelled, may be used in in vitro methods for the detection of Alzheimer's disease see also AAR33192. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting Alzheimer's disease using beta-amyloid peptide - includes quantitating amyloid deposition onto tissue samples, and using screen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antibodies which recognise specific subfragments of the beta-amyloid protein are claimed. Specifically, the antibodies (which are pref. monoclonal) recognise residues 1-16 and/or 1-28 from the N-terminal portion of beta-amyloid or they recognise residues 25-35 or 35-43 from the C-terminal portion. The antibodies are useful for assaying beta-amyloid and its derivatives for diagnosis of Alzheimer's disease. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a method for assaying the effectiveness of agents useful for ameliorating the neurotoxic effects of a condition associated with the accumulation of a beta-amyloid peptide. The method comprises:

(a) incubating potential inhibitors of neurotoxicity with an amyloidogenic amylin or beta 2-microglobulin; (b) measuring the neurotoxic properties of each amylin or beta 2-microglobulin; potential inhibitor mixture; and (c) detecting reduction in the neurotoxicity relative to a control. The preferred amyloidogenic amylin is human amylin. The method is especially for assessing the ability of an agent to smeliorate the neurotoxic effects of Alzheimer's disease or Down's syndrome. The method provides a more consistent beta-amyloid neurotoxicity assay and is more sensitive and covers a broader range. This is the amino acid sequence of human beta-amyloid 1-40 (beta1-40).
peptides AAM23335-36 are portions of the the amyloid beta peptide, which is the principal component of extracellular deposite in Alzheimer's disease. It has been shown to promote nuerite outgrowth, generate reactive oxygen intermediates, induce cellular oxidant stress, lead to neuronal cytotoxcity, and promote microglial activation. The present peptide, which comprises amino acids 1-40 of the amyloid beta peptide,
                                                                                                                                                                                                                                      Inhibiting damage to cells which inhibits interaction advanced glycosylation end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disease - by incubating or beta-2-microglobulin

A method for inhibiting interaction of an amyloid beta peptide with a receptor for advanced glycosylation on famyloid beta peptide with a receptor for cadvanced glycosylation on the surface of a cell comprises contacting the cell with e.g. present peptide. Depending on the type of cell, inhibiting ct advanced glycosylation can be used for inhibiting dead the receptor for cadvanced glycosylation can be used for inhibiting deapersation of a cell, inhibiting aggregation of a mayloid beta peptide into a cell, inhibiting aggregation of amyloid beta peptide into a cell, inhibiting aggregation of amyloid beta peptide on the surface of a cell, inhibiting infiltration of amyloid beta peptide into a cell, inhibiting aggregation of amyloid beta peptide into a cell, inhibiting activation of microglial cells by amyloid beta peptide. Cc and inhibiting activation of microglial cells by amyloid beta peptide. The methods can be used for treating e.g. diabetes, Alzheimer's Disease, contactity, Down's syndrome, dementia associated with head trauma, amyotrophic lateral sclerosis, multiple sclerosis or neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

```

A novel method has been developed of assaying for soluble amyloid precursor protein (sAPP). The method uses an antibody against amy beta-protein (A beta, produced from sAPP) or sAPP. The present serpresents amino acids 1 to 40 of amyloid beta-protein. sAPP can be represents amino acids 1 to 40 of amyloid beta-protein.

amyloid

Assay for soluble amyloid precursor protein useful to Alzheimer's disease - uses antibodies against amyloid new hybridoma producing antibodies.

diagnose beta-protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the N-terminus of A beta and a monoclonal antibody recognising sAPP, the cassay can be used to diagnose Alzheimer's disease. Senior plaque observed in the brain of Alzheimer's patients is primarily composed of A beta, which is generated from sAPP. Simple and accurate assay of sAPP is coposible. The antibody (preferably monoclonal) preferably has an antigen recognition site which is an amino acid sequence common to A beta and sAPP or specific to sAPP. The sAPP assayed for preferably has part of the A beta sequence at its amino terminus and is preferably solubilised through cleavage of the A beta between positions 16 (lysine) and 17 (leucine) from the amino acid terminus. The preferred method comprises immobilising one antibody (especially generated by (2)) on to an consoluble carrier, capturing a substance to be assayed on to this antibody, reacting another, labelling, antibody with the assay substance and detecting the activity of the labelling substance bound to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Loc

                                                             The present sequence was used in the development of a novel in vitro screening assay for agents capable of affecting the deposition of beta-amyloid peptide (BAP) on tissue. The method comprises contacting a silk sample with labelled BAP, optionally in the presence of a test agent, detecting the amount of label bound to the silk and assessing the effect of the agent on the deposition of BAP. Agents that inhibit binding of BAP to silk are potentially useful for treating amyloidosis diseases, especially Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                     New in vitro screening assay for Alzheimer's disease drugs - componssessing binding of labelled beta-amyloid peptide to silk sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 1998-168404/15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (MINU )

                                                                                                                                                                                                                                                                                                                                       and can be used in the method of the invention. The method is for inducing amyloid plaque deposition in a mammal by infusing into the brair an amyloid peptide (I) at a basic pH. Animals in which amyloid plaque deposition has been induced are models of human Alzheimer's disease (AD) and are used to screen for agents (A) that inhibit: (a) deposition of amyloid plaque; and (b) AD-associated disruptions to sleep and circadian activity. They may also be used to study the etiology of AD. Compared with known methods for inducing plaque deposition, this process causes less mechanical damage; the vehicle used is less neurotoxic and at basic pH (I) is soluble enough for delivery by continuous infusion with effective delivery to brain tissue. The control peptide causes few, if

                                                                                                                                                                                                                                                                                              This sequence represents a fragment of the beta-amyloid protein. The invention relates to a method for treating or preventing a form of amyloidosis, including Alzheimer's disease using this sequence. The compositions may be useful for treating or preventing the amyloidosis associated with long-standing inflammation, various forms of malignancy (including B-cell type malignancies), Familial Mediterranean Fever, multiple myeloma, plasma cell dyscrasias, long-term haemodialysis, carpal tunnel syndrome, joint swelling, multiple spontaneous fractures, radiolucency in the wrist and hip, endocrine tumours, medullary carcinoma of the thyroid, diabetes, Alzheimer's disease, Down's syndrome, creutzfeldt-Jakob disease, Gerstmann Straussler Syndrome, kuru, scrapie and other subacute spongiform encephalopathies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Beta-amyloid protein; Alzheimer's disease; amyloidosis; joint swelling; long-standing inflammation; malignancy; Familial Mediterranean Fever; multiple myeloma; plasma cell dyscrasia; long-term haemodialysis; kuru; carpal tunnel syndrome; multiple spontaneous fracture; radiolucency; endocrine tumour; medullary carcinoma; Down's syndrome; scrapie; Creutzfeldt-Jakob disease; Gerstmann Strausiler Syndrome;

The detection or monitoring of an amyloid aggregate in a sample can be used to diagnose or detect a predisposition to Alzheimer's disease. The screening assays can be used to identify compounds for the treatment or amelioration of Alzheimer's disease or its symptoms. The fluorescent derivatives of the amyloid-beta peptide are also useful for exploring other aspects of amyloid structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Glabe C,

Sequences AAW81466 to AAW81476 represent synthetic amyloid beta (Abeta) peptides. The invention provides a process for treating a synthetic Abeta peptide that comprises dissolving the peptide in a deoxygenated solvent selected from trifluoroethanol, hexafluorocyclohexane, dimethyl sulphoxide, morpholinopropanesulphonic acid, dimethylformamide and acetonitrile to a concentration of 0.01-10 mg/ml, incubating the solution at 20-65 deg. C for 0.5-4 hour, and removing the solvent by 'evaporative deposition' in 5-10 minutes. Synthetic amyloid beta peptides are useful as research tools for studying neurotoxicity resulting from Abeta peptide of the synthetic Abeta production. The treatment increases the activity of the synthetic Abeta peptides in tests to determine free-radical graduations synthetase inactivation
                                                                                                                                                                                                                                                                      macromolecules, for, e.g. identification of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta-amyloid protein; Alzheimer's disease; extracellular amyloid cerebral blood vessel; sulphated macromolecule; Kuru; congophilic maltese-cross spherical amyloid plaque; Creutzfeldt-Jacob disease; Gertsmann-Straussler syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                       This invention describes a novel method for the determination of the degree of aggregation of an amyloid beta A4 geptide (I) in solution. Determination comprises: (a) incubating a sample of unaggregated (I) with Coomassie Brilliant Blue G 250 dye (II) which only binds to unaggregated (I); (b) measuring the amount of (II) bound to (I) to obtain a value (i); (c) repeating steps (a) and (b) with a second sample at a different time to obtain a second value (ii); and (d) determining the difference between (i) and (ii) which is inversely related to the degree of aggregation of (I). This method may be applied to a screen for compounds that inhibit aggregation of (J). These inhibitors may be used as therapeutic drugs to inhibit the formation of these aggregates in the brains of patients suffering from Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                               WPI;
                                                                                 Sequence
                                                                                                                                                                                                                                                                                Disclosure; Col 5-6;

                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a method for screening compounds for inhibiting a neurotoxin. The method involves incubating tachykinin agonists with neuronal cells and a beta-amyloid peptide neurotoxin. The methods can be used for identifying compounds for treating diseases characterised by an undesirable build up of beta-amyloid protein, e.g. Alzheimer's disease, Down's syndrome, and the syndromes of hereditary cerebral haemorrhage with amyloidosis and non-inherited congophilic angiopathy with cerebral haemorrhage. AAW92655-W92731 are tachykinin agonists derived from human beta-amyloid peptide fragments. (Updated on 20-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening for neurotoxin inhibitors - by testing compounds for their effect on beta-amyloid peptide neurotoxic effect on neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        02-MAR-1999.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US5876948-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tachykinin agonist; beta-amyloid; inhibition; neurotoxin; treatment; Alzheimer: disease; Down's syndrome; amyloidosis; human; hereditary cerebral haemorrhage; non-inherited congophilic angiopathy.

                                                                                                       The present sequence represents a partial sequence of a human beta-
amyloid precursor protein (APP). The peptide is used to create chimeric
peptides of the invention. The chimeric peptides contain a N- or C-
terminal end-specific B cell epitope from a naturally occurring internal
peptide cleavage product of a precursor or mature protein, as a free N-
or C-terminus, joined to a T cell epitope, with or without a spacer amino
acid residue. Chimeric peptides comprising betaAPP peptides slow down,
reduce or prevent the accumulation of amyloid beta peptide in the
extracellular space, interstitial fluid and cerebrospinal fluid of the
brain, and aggregation into senile amyloid deposits or plaques. They also
block the interaction of amyloid beta peptides with other molecules that
contribute the neurocoxicity of amyloid beta. The chimeric peptides are
useful for immunizing humans against the free N- or C-terminus of an
internal self peptide cleavage product (e.g. APP peptide) derived from a
precursor protein or a mature protein. The internal peptide cleavage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel chimeric peptide containing N- or C-terminal end-specific B cell epitope from naturally occurring internal peptide cleavage product (su as beta amyloid peptide) of a precursor protein, joined to T cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a modified therapeutic peptide (I) CC comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidy] and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC components and neurotransmitters, to protect them from peptidase activity in CC vivo for the treatment of various disorders. Endogenous therapeutic competides are not suitable as drug candidates as they require frequent CC deministration due to rapid degradation by peptidases in the body.

CC Modifying and attaching therapeutic peptides to albumin prevents or CC reduces the action of peptidases to increase length of activity (half CC life) and specificity as bonding to large molecules decreases CC intracellular uptake and interference with physiological processes.

CC AAB90829 to AAB92441 represent peptides which can be used in the CC exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a modified therapeutic peptide (I) CC comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in CC vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent CC composed are not suitable as drug candidates as they require frequent CC administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half contracellular uptake and interference with physiological processes. CC AAB90829 to AAB92441 represent peptides which can be used in the cc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

The present invention describes a modified therapeutic peptide (I) CC comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidy) and maleimido groups) attached to CC conds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity in CC vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent CC peptides are not suitable as drug candidates as they require frequent CC modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half (if) and specificity as bonding to large molecules decreases (cc intracellular uptake and interference with physiological processes. CC AAB90829 to AAB92441 represent peptides which can be used in the CC exemplification of the present invention

peptidase
The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attrached to a less therapeutically active amino acid region (IV), which covalently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.
                                                                                                                                                                                                                                                                                                       WPI; 2001-112059/12.

                                                                                                                                                                                                                                                             bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (1) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity i vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half intracellular uptake and interference with physiological processes. Alago829 to Alago2441 represent peptides which can be used in the exemplification of the present invention
